

Less is more.

1.1 gpf
for max-
efficiency

The demand for water conservation is driving flush volumes ever-lower. The new threshold is 1.1 gpf. At 1.1 gpf, it is more important than ever that the flushometer and the fixture work in harmony to deliver the evacuation performance and drain line carry that is necessary. Sloan has met that challenge and after unprecedented testing, is confidently introducing its broad line up of manual and electronic flushometers, paired with its top performing fixtures. The result is reliable performance that you've come to expect from Sloan.

Water conservation is our passion. Reliability is our business.
